

Laboratory assignment №3

Topic: : Partial Views. Navigation. Filtering. Sessions.

Goal: gain skills in working with partial views, learn to work with query string parameters, and acquire skills in working with sessions.

Workflow:

Task 1. Create Partial View

1. In the Views/Shared folder, create a .cshtml file for the single item from the entity list (for SportsStore it will be ProductSummary.cshtml)

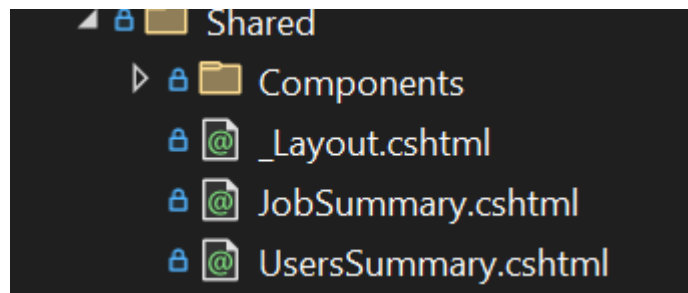

Fig 1 – My summary .cshtml

2. Move the code for the single item from the shared View Index.cshtml into the created file.
3. Use the created Partial View in Index.cshtml using the <partial> Tag Helper

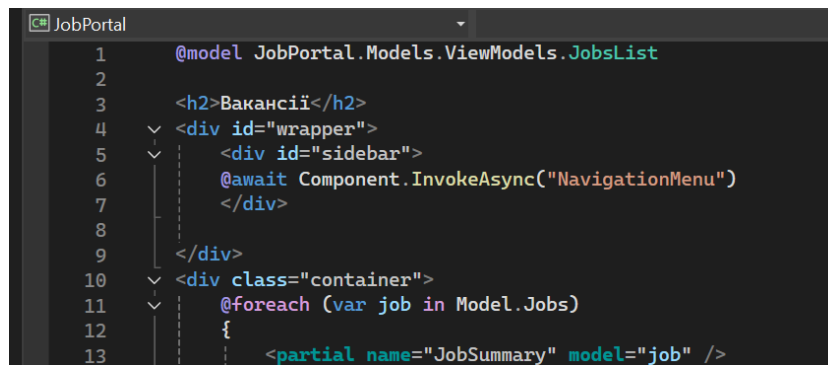

Fig 2 – Using partial views

Task 2. Category navigation

Implement the navigation by category (or by another feature that suits your needs) by following these steps:

					ДУ «Житомирська політехніка».24.121.11.000 – Лр3

Керівник								1
Н. контр.							ФІКТ, зр. ІПЗк-24-1	
Зав. каф.								

1. In the project folder, create a Components folder, create a file named `NavigationMenuViewComponent.cs`, and implement it as in the following listing:
`using Microsoft.AspNetCore.Mvc;`

```
namespace SportsStore.Components
{
    public class NavigationMenuViewComponent : ViewComponent
    {
        public string Invoke()
        {
            return "Hello from the Nav View Component";
        }
    }
}
```

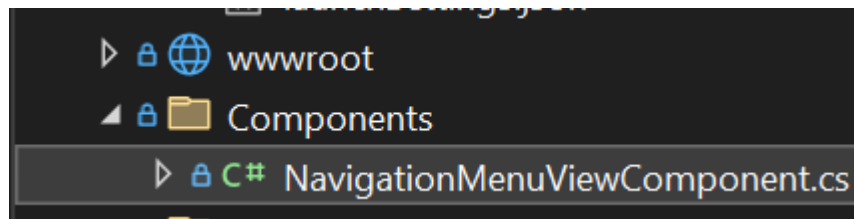

Fig 3 – Added component

2. In the shared layout (`_Layout.cshtml` file), add the markup for the sidebar. In the added markup, add a call to the created `NavigationMenuViewComponent`. The structure of your page should look like the one shown in Figure 2.1

```
@model JobPortal.Models.ViewModels.JobsList

<h2>Вакансії</h2>
<div id="wrapper">
    <div id="sidebar">
        @await Component.InvokeAsync("NavigationMenu")
    </div>
    <div id="main">
        @RenderBody()
    </div>
</div>
```

Fig 4 – Creating bar with using `NavigationMenuViewComponent`

1. Modify the `NavigationMenuViewComponent` implementation so that the component receives a list of categories from the database and returns a result of type `ViewComponentResult`.

```

var categories = repository.Jobs
    .Select(j => j.Category.CategoryName)
    .Distinct()
    .OrderBy(c => c)
    .ToList();

categories.Insert(0, "Bci");

return View(categories);

```

Fig 5 - Modify the NavigationMenuViewComponent implementation

2. Create the Default.cshtml file in the Views/Shared/Components/NavigationMenu folder. You can read more about the naming conventions that Razor uses to work with ViewComponents [here](#).

Fig 6 – Default.cshtml

3. In the created View file, implement the output of the list of links received from the ViewComponent.
4. In the Controllers/HomeController.cs file, in the Index() method, implement support for filtering by category.
5. Modify the ViewModel to display information about the selected category in the view. This info is needed to format page URL regarding the selected category.
6. Implement the highlighting of the category selected by the user. To do this, pass information about the selected category from View Component to View.
7. Change the paging implementation so that it displays the number of available pages according to the selected category.

```

public IActionResult Index(string category, int page = 1)
{
    var jobs = repository.Jobs
        .Where(j => category == null || category == "Bci" || j.Category.CategoryName
        .OrderBy(j => j.JobID)
        .Skip((page - 1) * PageSize)
        .Take(PageSize);

    var viewModel = new JobsList
    {
        Jobs = jobs,
        PagingInfo = new PagingInfo
    }
}

```

Fig 7 – Pagging the items

Task 3. Sessions

Implement the feature from the table using [session](#) mechanism 3.1.

3	Job Portal	Save job applications in progress using sessions, so candidates can continue filling out forms if they leave the page.
---	------------	--

Fig 8 - My option

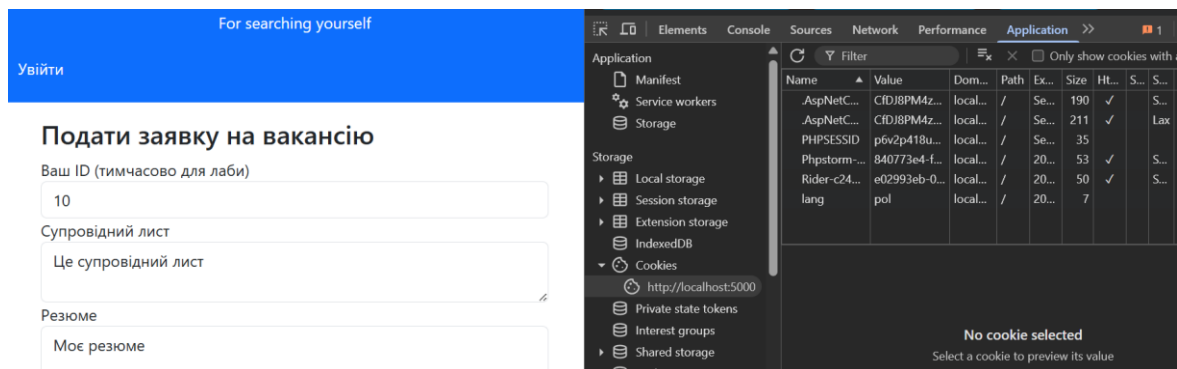

Fig 9 – Storage the info from form in cookies with session

Conclusions: During the laboratory work, I gain my skills in working with partial views, learn to work with query string parameters, and acquire skills in working with sessions.
